

ARAXIS REPLACE IN FILES

The screenshot shows the Araxis Replace in Files application window. It is divided into three main sections:

- 1 Choose files and folders to search:** A list of files and folders is shown, with a path of /Users/djn/Documents/Examples.
- 2 Specify the text to find and replace:** The 'Find' field contains 'oppress' and the 'Replace' field is empty. A 'Start Search' button is visible.
- 3 Review search results:** A list of search results is displayed, including file names like 'Memoirs of Louis XIV.txt' and 'Mémories d'une Contemporaine.html', along with the number of matches found in each file.

A 'Preferences' dialog box is open, showing the 'File Kinds' tab. It lists various file types and their corresponding patterns or UTIs, such as 'All files', '.txt files', 'Any', 'Text', 'Documents', and 'Source Code'. The 'Text' option is selected.

Text overlay on the right side of the image reads: "Quickly **find & replace text** across 1000s of source, HTML, XML or other text files". Below this text are two buttons: "TRY FREE FOR 7 DAYS" and "BUY NOW".

Efficient

Preview search results and work interactively, or replace all matches in one go.

Easy

Delightfully [easy to use](#).

Precise

Match exact text, or optionally search using a [regular expression](#) (regex).

Flexible

Process files with different text encodings (ASCII, UTF-8, UTF-16, etc.)

Focused

Restrict searches to particular file types.
